Field of the Invention The present invention relates to the field of electronic timers and, more specifically, to an apparatus for setting a digital timer. 2. Description of the Related Art Electronic timers are often used to alert a person to the passage of a specified time period. For example, an electronic timer can be used to trigger a security alarm at a predetermined time and day. Other electronic timers can be used to turn on lights, open or close windows, etc. In order to provide the desired functionality for the electronic timer, a conventional electronic timer is usually provided with a fixed set of programmable parameters for different time intervals. For example, the fixed set of programmable parameters may comprise a duration for a particular event such as ringing a bell for five minutes, opening a door for two minutes and closing the door for two minutes. More elaborate electronic timers may also be provided with more flexible sets of programmable parameters for various options or functions. In some conventional electronic timers, the fixed set of programmable parameters are selected by the user by selecting a combination of switches. Alternatively, more complex electronic timers may permit a user to enter various sets of programmable parameters or command codes to perform various functions. In these more complex electronic timers, the user may enter the desired set of programmable parameters or command codes by using a keyboard or a manually operable device such as a touch screen.
